FISHERIES INVESTIGATIONS**

ATLAS No. 16

We note with sadness the passing of
Hans T. Klein on 7 September 1972

an editor and a founder of
the CalCOFI Atlas series

CALIFORNIA
COOPERATIVE
OCEANIC
FISHERIES
INVESTIGATIONS

Atlas No. 16

STATE OF CALIFORNIA
MARINE RESEARCH COMMITTEE

Cooperating Agencies:

CALIFORNIA ACADEMY OF SCIENCES
CALIFORNIA DEPARTMENT OF FISH AND GAME
STANFORD UNIVERSITY, HOPKINS MARINE STATION
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION, NATIONAL MARINE FISHERIES SERVICE
UNIVERSITY OF CALIFORNIA, SCRIPPS INSTITUTION OF OCEANOGRAPHY

June, 1972

THE CALCOFI ATLAS SERIES

This is the sixteenth in a series of atlases containing data on the hydrography and plankton from the region of the California Current. The field work was carried out by the California Cooperative Oceanic Fisheries Investigations,¹ a program sponsored by the State of California under the direction of the State's Marine Research Committee. The cooperating agencies in the program are:

California Academy of Sciences
California Department of Fish and Game
Stanford University, Hopkins Marine Station
National Oceanic and Atmospheric Administration, National Marine Fisheries Service²
University of California, Scripps Institution of Oceanography

CalCOFI atlases³ are issued as individual units as they become available. They provide processed physical, chemical and biological measurements of the California Current region. Each number may contain one or more contributions. A general description of the CalCOFI program with its objectives appears in the preface of Atlas No. 2.

This atlas was prepared by the Data Collection and Processing Group of the Marine Life Research Program, Scripps Institution of Oceanography.

CalCOFI Atlas Editorial Staff:

Abraham Fleminger, Hans T. Klein and John G. Wyllie, Editors

CalCOFI atlases in this series, through June 1972, are:

- No. 1. Anonymous, 1963. CalCOFI atlas of 10-meter temperatures and salinities 1949 through 1959.
- No. 2. Fleminger, A., 1964. Distributional atlas of calanoid copepods in the California Current region, Part I.
- No. 3. Alvariño, A., 1965. Distributional atlas of Chaetognatha in the California Current region.
- No. 4. Wyllie, J. G., 1966. Geostrophic flow of the California Current at the surface and at 200 meters.
- No. 5. Brinton, E., 1967. Distributional atlas of Euphausiacea (Crustacea) in the California Current region, Part I.
- No. 6. McGowan, J. A., 1967. Distributional atlas of pelagic molluscs in the California Current region.
- No. 7. Fleminger, A., 1967. Distributional atlas of calanoid copepods in the California Current region, Part II.
- No. 8. Berner, L., 1967. Distributional atlas of Thaliacea in the California Current region.
- No. 9. Kramer, D., and E. H. Ahlstrom, 1968. Distributional atlas of fish larvae in the California Current region: Northern Anchovy, *Engraulis mordax* Girard, 1951 through 1965.
- No. 10. Isaacs, J. D., A. Fleminger and J. K. Miller, 1969. Distributional atlas of zooplankton biomass in the California Current region, Spring and Fall 1955-1959.
- No. 11. Ahlstrom, E. H., 1969. Distributional atlas of fish larvae in the California Current region: jack mackerel, *Trachurus symmetricus*, and Pacific hake, *Merluccius productus*, 1951 through 1966.
- No. 12. Kramer, D., 1970. Distributional atlas of fish eggs and larvae in the California Current region: Pacific sardine, *Sardinops caerulea* (Girard), 1951 through 1966.
- No. 13. Smith, P. E., 1971. Distributional atlas of zooplankton volume in the California Current region, 1951 through 1966.
- No. 14. Isaacs, J. D., A. Fleminger and J. K. Miller, 1969. Distributional atlas of zooplankton biomass in the California Current region: Winter 1955-1959.
- No. 15. Wyllie, J. G., and R. J. Lynn, 1971. Distribution of temperature and salinity at 10 meters, 1960-1969 and mean temperature, salinity and oxygen at 150 meters, 1950-1968 in the California Current.
- No. 16. Crowe, F. J. and R. A. Schwartzlose, 1972. Release and recovery records of drift bottles in the California Current region, 1955 through 1971.

¹Usually abbreviated CalCOFI, sometimes CALCOFI or CCOFI.

²Formerly called U. S. Fish and Wildlife Service, Bureau of Commercial Fisheries.

³For citation this issue in the series should be referred to as CalCOFI Atlas No. 16.

Charts	2-140

INTRODUCTION

The results from drift bottle studies of inshore currents on the Pacific coast of British Columbia, Oregon, California and Baja California [Tibby, 1939; Dodimead & Hollister, 1958; Fofonoff, 1960; Schwartzlose, 1963; Wyatt, *et al.*, 1971; Badan, 1972] demonstrate their usefulness as indicators of the direction of surface flow. For example, few other data show as clearly the presence of the Davidson countercurrent during the late fall and winter months [Schwartzlose, 1963].

In late 1954 Scripps Institution of Oceanography's component of CalCOFI, the Marine Life Research Group, began using drift bottles to study seasonal variation in the inshore portion of the California Current. During the intervening 17 years 148,384 drift bottles were released and approximately 3.4 percent [4,995] were recovered.

DRIFT BOTTLE SPECIFICATIONS

Several sizes of drift bottles have been used by the CalCOFI program. All were of clear heavy glass and ranged in capacity from 4 to 6 ounces. A pre-addressed reply card [prepaid when mailed in the U.S.] sealed inside each bottle describes the program in English and Spanish and requests the finder to record the location, date and hour of recovery on the card and return it to Scripps Institution of Oceanography. After inserting the card in the bottle, sand is added to ballast the bottle so that it will float with no more than one inch of the neck extending above the surface of the water. The bottles are closed with a cork and sealed with wax. Each person returning a card is sent a letter of acknowledgment stating the date and place the bottle was released.

In December of 1966 plastic drift cards were released in addition to our normal complement of drift bottles at CalCOFI stations. The corrosive action of seawater quickly destroyed the metal staples used to assemble the drift cards. Moreover, there was suspected wind "wafting" of the lightweight plastic cards across the sea surface. Returns from drift cards were less satisfactory as compared to drift bottles from the same stations.

RELEASE AREAS

The areas dealt with month by month differ somewhat due to variations in the northern and southern extent of individual CalCOFI cruises.

Figure 1. Monthly summary of areas in which drift bottles were released during CalCOFI cruises between 1955 and 1966. Asterisks denote months with no recoveries.

Figures 1 and 2 summarize the release areas by months and years that are presented in this atlas. Months marked with an asterisk indicate no recoveries were made. It should be noted that most of these months were also characterized by the release of relatively few drift bottles.

Normally twelve bottles were released on each prescribed station of the cruise pattern. Otherwise, the number released is indicated adjacent to the station dot.

DRIFT BOTTLE RETURNS

The percentage of recovered drift bottles varied from zero for some months to as high as 23.0 percent. The average is about 3.4 percent. Table 1 presents a complete monthly listing of the number of stations at which drift bottles were released, the number of releases, the number of finds and the percentage recovered for the month. The percentage recovered also appears on the individual monthly charts.

The northern-most return was from Montague Island, Alaska [August 1968], the southern-most came from an area just north of Aca-

pulco, Mexico [May 1959], and the westernmost return was from the island of Hawaii [September 1969].

THE CHARTS

The charts in this atlas are somewhat different from those in previous CalCOFI atlases. Data are grouped by months rather than by cruises. Consequently there are months in which two sets of releases were made at one or more stations because two separate cruises occupied the station during that month.

Release points are designated by a dot or by a circle with a letter in it [Fig. 3]. Circles with a letter represent the stations from which returns were received. Stations indicated only by a dot represent the release of 12 drift bottles and no returns. A number accompanying the station dot or a shaded area indicates the number of drift bottles when it differed from the usual 12. An arrow attached to the lettered circle shows the direction in which to look for returns from the station. Returns for a particular station will be listed by the same letter appearing in the station circle and an arrow or line

Figure 2. Monthly summary of areas in which drift bottles were released during CalCOFI cruises between 1967 and 1971. Asterisks denote months with no recoveries.

Figure 3. Example of the notational system used on the charts in this atlas.

extending to the point of recovery at the shoreline. The letter 'I' has not been used to avoid confusion with the number one. When the number of stations showing returns exceeds 25 in any one month, the additional stations are denoted by lower case letters beginning the alphabetical sequence anew. At the recovery point the number following the station letter indicates the number of days elapsing between the time of release and the time of recovery. When more than one return is available for a given release at one station, the days elapsed for each return are indicated separately after the letter identifying the station. Some charts

have an insert with an area enlarged to show complex or unusual returns.

One uncontrollable factor influencing the frequency of drift bottle recoveries and interpretation of the results is the intensity of human traffic along the coastline. A population density chart of the California coast is presented [Fig. 4] as an aid to judging the distribution and elapsed time of returns. The population data is based on the national census of 1960 [Anon., 1970]. For Baja California only the location of cities, towns, and settlements are shown, this being a very sparsely settled region.

Figure 4. Population density along the west coast of the United States and locations of permanent settlements in Baja California.

DRIFT BOTTLES
 DECEMBER 1969

These maps are designed to show essential details of the area most intensively studied by the California Cooperative Oceanic Fisheries Investigations. This is approximately the same area as is shown in color on the front cover. Geographical place names are those most commonly used in the various publications emerging from the research. The cardinal station lines extending southwestward from the coast are shown. They are 120 miles apart. Additional lines are utilized as needed and can be as closely spaced as 12 miles apart and still have individual numbers. The stations along the lines are numbered with respect to the station 60 line, the numbers increasing to the west and decreasing to the east. Most of them are 40 miles apart, and are numbered in groups of 10. This permits adding stations as close as 4 miles apart as needed. An example of the usual identification is 120.65. This station is on line 120, 20 nautical miles southwest of station 60.

The projection of the front cover is Lambert's Azimuthal Equal Area Projection. The detail maps are a Mercator projection.
