## CONTENTS

List of Figures . . . . .	ii
Introduction . . . . .	iii
Personnel . . . . .	vii
Tabulated Data . . . . .	1
Distribution List . . . . .	145

## FIGURES

1. CCOFI Cruise 6501, station positions
2. Horizontal distribution of dynamic height anomaly (0 over 500 d-bar)
3. Horizontal distribution of dynamic height anomaly (200 over 500 d-bar)
4. Horizontal distribution of temperature at 10 meters
5. Horizontal distribution of salinity at 10 meters
6. Horizontal distribution of thermosteric anomaly at 10 meters
7. Horizontal distribution of phosphate at 10 meters
8. Horizontal distribution of silicate at 10 meters
9. Horizontal distribution of depth to the thermocline
10. Horizontal distribution of temperature at 200 meters
11. Horizontal distribution of salinity at 200 meters
12. Horizontal distribution of thermosteric anomaly at 200 meters

## INTRODUCTION

The data presented in this report were collected by the RV Black Douglas of the Bureau of Commercial Fisheries and the RV Alexander Agassiz of the Scripps Institution of Oceanography on Cruise 6501 of the California Cooperative Oceanic Fisheries Investigations program. The first two figures in this cruise numbering system represent the year of the cruise; the last two figures, the month. The cruises preceding this one in the series are 6401 (Scripps Institution report, SIO Ref. 65-7) and 6410 (SIO Ref. 65-18).

The data are accompanied by charts of horizontal distribution. The presentation of data in this report does not constitute publication; however, the data contained in this report have been carefully edited and no modifications should be necessary before final publication.

## TABULATED DATA

The data were obtained by bottle casts and by the in situ Salinity/Temperature/Depth Monitoring and Recording System (STD) and are presented in three forms:

1. When a station consisted of a bottle cast only, the data are presented in the usual fashion, with standard depth values interpolated and computed from the bottle cast data.
2. When a station consisted of an STD lowering only, the original record (reduced from 24 x 24 cm) is reproduced on the right. Values of temperature and salinity read at selected levels appear on the left with the appropriate calculations. A tracing of the STD record with the scale changes eliminated appears on the lower part of the page.
3. When a station included both a bottle cast and an STD lowering, both sets of data are shown, as above: the standard depth and computed values are taken from the STD record. The bottle cast data are plotted on the original STD record.

## STANDARD PROCEDURES

### In situ Salinity/Temperature/Depth Recorder

The manufacturer of the STD claims for the temperature an accuracy of  $\pm 0.05^{\circ}\text{C}$  on all ranges with repeatability of  $\pm 0.01^{\circ}\text{C}$  and for the salinity an accuracy of

$\pm 0.03\%$  on all ranges with repeatability of  $\pm 0.01\%.$ <sup>1/</sup> Except for the depth range corresponding to the steepest part of the thermocline, where the salinity trace appears to fluctuate more widely than the bottle samples can confirm, the results of this cruise support the manufacturer's claims.

For this cruise only, a calibration correction of  $-0.03\%$  was applied to the salinity readings: this correction was determined from sample bottles placed directly on the STD wire at 10 meters depth and next to the instrument, and from the bottle casts which immediately preceded (15 to 30 minutes) the STD lowering.

#### Hydrographic Casts

The observed data have been plotted and then evaluated using the method described by Klein.<sup>2/</sup> This involves consideration of their variation as functions of density or depth and their relations to each other, and comparison with concurrent bathy-thermogram or STD observations and with previous or adjacent observations.

To indicate degree of accuracy, temperatures are recorded in tenths of a degree when obtained by bucket thermometer, thermograph or bathythermograph, while temperatures from reversing thermometers are recorded in hundredths of a degree. The salinity of the collected samples when determined by salinometer is recorded to three decimal places, provided it meets accepted standards. The values recorded "have a reproducibility of  $\pm 0.004\%$  salinity at the 95 per cent probability level and a probable accuracy of  $\pm 0.01\%$  salinity or better at the same level of probability."<sup>3/</sup> The values are recorded to two decimal places when obtained by chlorinity titration, or by salinometer where only one determination per sample was obtained, or where there is doubt concerning the accuracy of a particular sample, or of all samples on a station. The accuracy of all samples obtained by salinometer and recorded to two decimal places is believed to be equal to or better than those obtained by manual titration.

Extrapolated values and values interpolated between remote observations are entered within parentheses. A hyphen is used to indicate a missing observed value. The

<sup>1/</sup> In situ Salinity/Temperature/Depth Monitoring and Recording System, Model 9006, Tech. Rep. No. 102, HYTECH Marine Products, The Bissett-Berman Corporation.

<sup>3/</sup> Quotation from Department of Oceanography, University of Washington, Tech. Rep. No. 66, UW Ref. 60-18, October 1960.

time is the time of messenger release when there was a bottle cast. The start down times for all STD lowerings are entered on the original recordings, and also in the heading when only STD values are tabulated. When more than one bottle cast was made on a station, messenger times and wire angles are given in the order of increasing depth. A line is left blank between the observed data of each cast.

On stations where more than one cast is lowered, the various property curves may not agree perfectly. This discrepancy may be caused by changes in geographical position, real property changes with time, slight error in measurement, or a combination of these factors. Stations with overlapping casts have the following footnote: Overlapping casts; reconciliation of property curves when necessary.

#### FOOTNOTES

Laboratory personnel note any possible imperfections in the sealing of the sample bottles as follows:

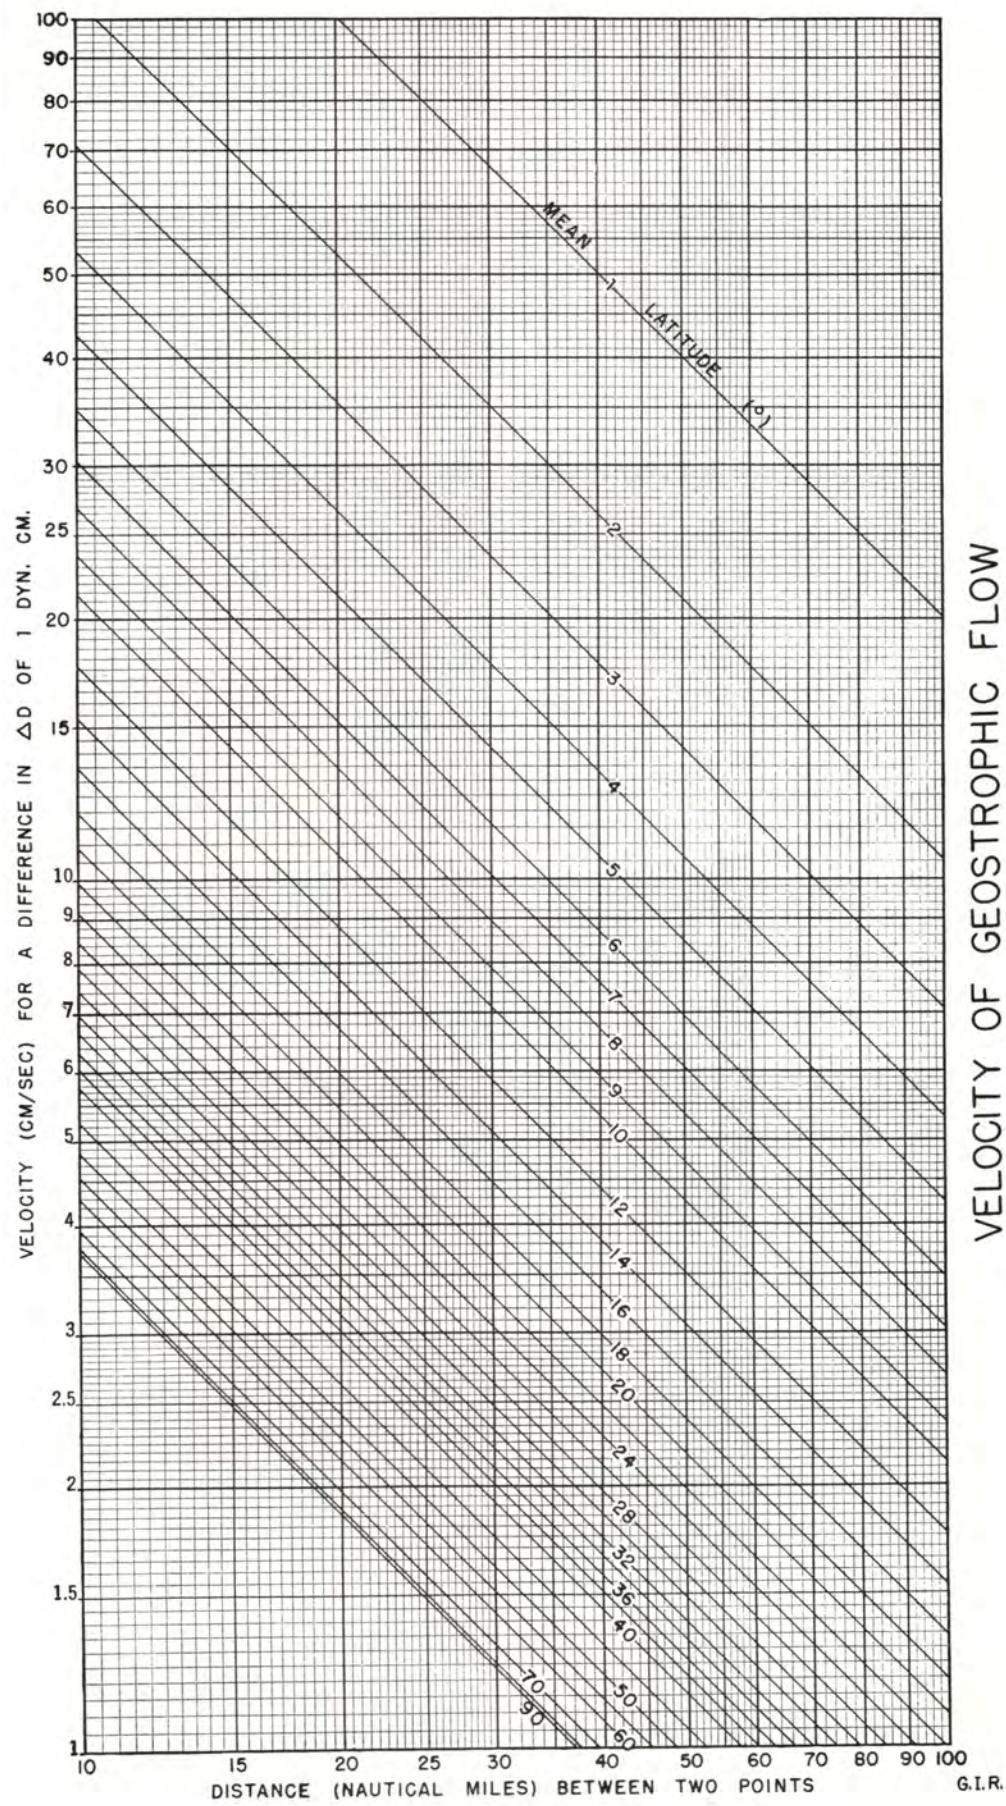

- |                       |  |
|-----------------------|--|
| Loose bottle cap:     | The cap is definitely loose so that it could be moved with very little applied pressure. The salinity values obtained from these samples may be usable depending on time and/or conditions of storage. |
| Possible evaporation: | Either the cap was sealed with less than usual pressure, the bottle edge chipped, the rubber washer cracked, or the bale broke on opening, etc.  |

Use of the above values in interpolation on stations where no STD lowering was made, depends upon consistency with other values of salinity and other properties and these footnotes are supplemented with "falls on property curve" or "does not fall on property curve," depending upon whether or not the property curve was drawn through the value.

In addition to footnotes, one special notation is used without a footnote because the meaning is always the same. Values which seem to be in error without apparent reason are indicated by the following notation:

- u: uncertain value (value may be correct; occasionally it can influence the drawing of the property curve on stations where no STD lowering was made).

a) This station was occupied twice during the cruise. Each occupation consisted of two 500 meter STD lowerings exactly one and one-half hours apart with a 600 meter hydrographic cast in between. The fine structure of the temperature and salinity curves of the STD was needed for comparison with a recording buoy thermometer at the same location.
